

Transparent Bundler™ & Automated Supply Distribution (ASD)

A positioning and product framework for visible supply control and responsible market-based distribution of team-held tokens.

The Core Problem

Crypto markets routinely hold teams accountable for price movements as if teams control supply, while simultaneously condemning teams when they visibly retain supply to manage distribution.

- Teams are blamed for price declines under the assumption of hidden selling.
- Teams are criticized for holding supply when that control is visible.

The underlying issue is not supply control itself, but invisible and poorly framed supply control.

The Reframe: From “Bundling” to Supply Control

The term “bundling” is emotionally loaded and adversarial. In reality, teams are managing supply control over time.

Every functioning market follows a lifecycle:

- Early stage: supply is intentionally concentrated.
- Growth stage: supply is gradually distributed.
- Mature stage: supply becomes widely market-owned.

Transparent Bundler exists to make supply control visible, measurable, and contextualized.

Transparent Bundler™ (Conceptual Overview)

Transparent Bundler is a real-time supply control signal derived solely from observable, declared wallet data.

- How much supply does the team currently control?
- How is that control changing over time?
- Is the current level of control appropriate for the project’s lifecycle stage?

Core Metrics

Team Supply Control Percentage

Percentage of total supply held by team-declared wallets.

Supply Control Trend

Directional change in team-held supply over time.

Distribution Velocity

Rate at which team-held supply exits into the open market.

Indicator States

- Controlled
- Transitioning
- Low Control
- Minimal Control

Automated Supply Distribution (ASD): Explicit Clarification

ASD distributes team-held supply by selling it into the open market.

Distribution occurs through controlled, rule-based market sales — not wallet shuffling or artificial decentralization.

ASD Design Principles

- Non-discretionary, rule-based selling.
- Sell only into available liquidity.
- Caps on sell size.
- Automatic pauses during extreme volatility.
- Full execution transparency.

What ASD Does Not Do

- Guarantee price direction.
- Promise zero market impact.
- Manipulate markets.

How They Work Together

Transparent Bundler shows how much supply is controlled and how it changes.

ASD shows the predefined rules by which that supply is sold into the market.

Cultural Shift

- Teams plan distribution openly.
- Holders judge behavior on data.
- Markets move from rumor to structure.
